How hackable is Dortress Password Manager?

A plain-English scorecard. The attacker is a nation-state with unlimited money, a GPU farm, your vault file and the full source code.
10 = practically impossible to hack, 1 = trivial.

9.5	7	BOTTOM LINE
STOLEN VAULT FILE, GOOD MASTER KEY	REAL WORLD VS A NATION-STATE	The locked vault file is a dead end for attackers, as long as the master key is generated by the app or uses a key file kept elsewhere. Real attacks go around the encryption: an unlocked laptop, malware, a guessable password, or a key file stored next to the vault.

The scorecard

Attack	What it means	Hard to hack
THE VAULT FILE IS STOLEN		
Guess a password made by the app's generator	24 random characters: about 2^{156} combinations. Not even close to possible.	10
Guess the 'Dortress 20' preset password	10 numbers, 3 upper, 3 lower, 4 special: ~23 trillion years at a trillion guesses per second.	9.5
Guess a password YOU made up	Names, dates, phone numbers and keyboard patterns are tried first. Days to months.	3
Key-file mode, key file kept somewhere else	They must find one exact file anywhere in the world. Its 512-bit hash can't be guessed.	10
Key file kept next to the vault (same USB)	Like taping the key to the lock. Whoever takes the USB opens the vault.	1
Password + key file	They need both. Stealing one alone is useless.	10
Secretly edit or corrupt the vault	Any change is detected and the vault refuses to open. Older copy kept as .bak.	9.5
Future quantum computer	AES-256 still keeps ~128-bit strength. No RSA/ECC for quantum to break.	9
THEY GET TO YOUR COMPUTER OR YOU		
Laptop grabbed while the vault is open	Everything is on screen. Auto-lock (default 5 min) is the only defence.	1
Malware or keylogger on the PC	It records the master password as you type it. True for every password manager.	2
Clipboard snooping	Copied passwords clear after 20 s, but Windows clipboard history (Win+V) can keep them.	6
Memory forensics on a running PC	Python can't fully wipe secrets from RAM after locking. Close the app when done.	5
A hidden bug in the code	Uses proven libraries and was tested, but no outside expert has reviewed it yet.	6

Five habits that keep you at 9.5

1. Let the app **generate** your master password, or use Password + key file.
2. Keep the key file **away from the vault**, with a backup copy somewhere safe.
3. **Lock** the vault and close the app when you step away. Never leave it open.
4. Turn off Windows **clipboard history** (Win+V) and keep antivirus on.
5. Never type your master password on a computer you don't trust.
